

PRESS RELEASE November 12th, 2009 Everon UK Limited

New care home Telecare system to be launched at TSA conference

Finnish market leader brings wireless system to the UK for the first time

Everon, the market leading care home alarm system in Finland, will become available to UK customers from next week. The system, which in little over a year has gone from launch to number one in the Finnish market, will be launched at the National Telecare & Telehealth Conference at the London Hilton Metropole on Monday the 16th November.

The Everon system's popularity has been due to the winning combination of a totally wireless GPRS and RF based alarm system that is at the same time, continuously monitored. Everon's combination of monitored reliability with a cost effective, minimal installation system has led to over 4,000 care home residents using the system in Finland. A key advantage for UK buyers is the ability of Everon to be easily deployed only for selective residents in each care home whereby a resident with particular needs, such as dementia, can create an alarm if they try to exit, leaving other residents to roam freely. Additional sensors and devices can be added to the system simply at the press of a button and many are battery powered. The Everon system also contains a full web based alarm management system that can direct alarms based on alarm type, alarm id and time to an alarm routing of recipient's mobile phones, it even senses that the mobile has been answered before confirming receipt of the alarm and then allows the user to dial back into the site to monitor and remotely control the situation.

Everon will also be demonstrating the Everon Vega GPS bracelet for Alzheimer and other cognitive disorders. The system, which has been purpose built for this market, is now available to councils on a rental basis with costs per user ranging from just over £1 per day.

Mark Johnson, director of Everon UK commented, "We are really excited about bringing the Everon system to the UK. The success in Finland has been remarkable and we are confident we will repeat this here now it is available to UK buyers. With Everon and Vega we think we are going to have a busy conference showing people both systems."

Enquiries regarding Vega, Urgentys or Everon should be directed to email mark.johnson@everon.net or telephone +44 7896 413868 or +44 8453 712850

Everon™ is a totally wireless IP based system that is used in health care applications like nurse calls and personal safety. The secured system is based on a patented method and a server structure that constantly monitors that all devices are connected. The alerts can be delivered to normal GSM phones by calls and text messages and the system makes sure that all activations are transferred correctly. The Everon system is the most flexible and economical solution to various needs within health care and other applications as it requires no subscriptions or cabling.
