

3rings Care Launches its new IoT Platform **with “Things that Care®”**

Unique solution helps care professionals and families to deliver the right care at the right time

3rings Care is launching its unique IoT Platform of Things that Care this will give 3rings an opportunity to share with care professionals the ways in which the new 'Patterns of Life' platform helps to increase efficiency and improve outcomes using the very latest in IoT technologies.

3rings' focus is on delivering digital innovation across three areas:

- Agnostic solutions which enables personalised care packages and the adoption of new IoT technology as soon as it appears e.g. Amazon Echo, Nest
- Rules and Events engine that allows families and care professionals to create a safety net for vulnerable people
- Trend analysis and self-learning algorithms which provide 'glancible' understanding and form the beginnings of prevention updates

Unshackle the future from hardware

The new 3rings platform provides a complete range of sensors that build a 'Pattern of Active Life' for vulnerable individuals. This includes the 3rings plug that turns any existing domestic appliance into an IoT sensor and sends a notification via an app in the event of unusual behaviour.

The core platform is agnostic from hardware and can support an increasing range of 3rd party IoT devices as they become available, meaning care professionals can prescribe person-centred solutions from range of manufacturers and can easily add or replace sensors with the next best thing as they become available.

contd . . .

. . . contd

Rules, events and alerts

A powerful rules engine allows families and professionals to create and manage a safety net for people who need care. Anyone with access to the internet can now contribute to someone's care, whether they are in the same street or on a different continent. This provides reassurance to the user and their family, and reduces the need for statutory services.

Prediction and trends – The future of care

Building a 'pattern of life' is a direct outcome of the latest IoT sensors that collect data such as environmental conditions and activity. But it is the analysis of this data, delivering trend identification and insight, which is the key benefit of the 3rings platform. Going one step further, the introduction of self-learning algorithms is the beginning of being able to warn of potential changes that may result in an adverse care need.

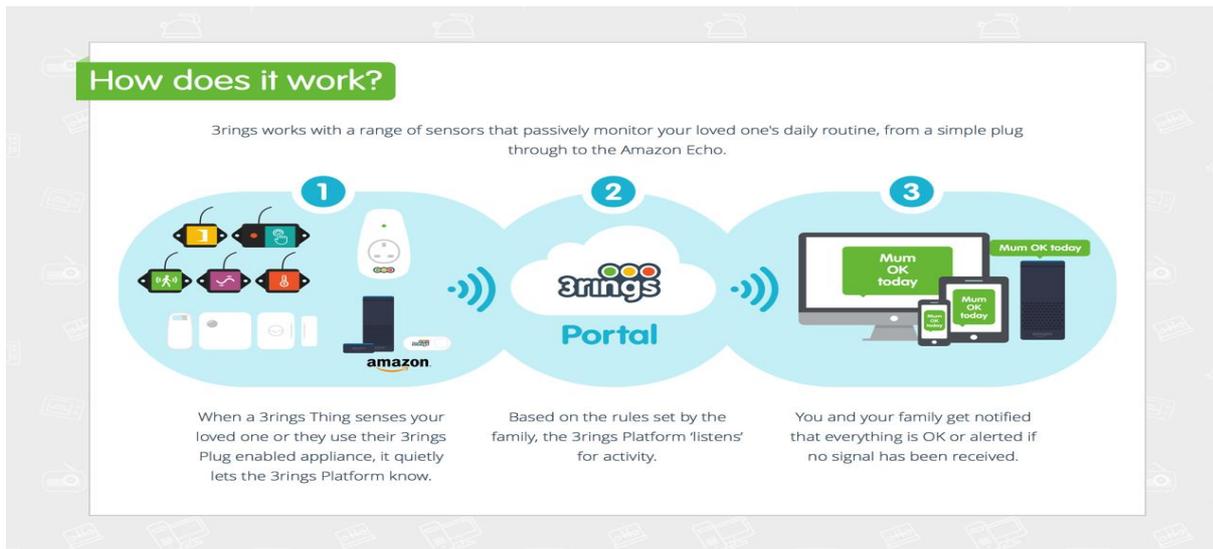

The innovative 3rings care platform is helping its customers to:

- Support and care for users and their members
- Ensure safety and provide support
- Promote choice
- Enable efficiencies in resource planning
- Offer bespoke and flexible packages of care
- Provide holistic Pattern of Active Life support
- Benefit from the very latest IoT technologies
- Transform health and social care

Steve Purdham, 3rings Chairman commented "Health and care providers face the dual challenge of rising demand and diminishing budgets. Finding new ways of delivering the right care at the right time, whilst delivering improved outcomes and economic benefits is a priority. Our new platform gives professionals real time information to support efficient care planning and delivery, and provides a cost effective means of managing risks and providing tailored care to people to enable them to stay independent at home."
